

## Step by Step Report

"We began by prioritizing the creation of our CarKonnnect webpage's Landing Page, employing HTML for the structure and CSS for its visual appeal. Successfully testing it on Visual Studio code marked our initial achievement. Subsequently, our focus shifted to enhancing the navigation bar by expanding its options, a task accomplished over the following weeks.

Our progress included the addition of an 'About Us' page, intended to inform users about our webpage's objectives and offerings. We introduced a streamlined three-step process—Quote, Bid, and Sell—on the sell page, allowing users to submit their car details for updates after quoting a price. Furthermore, this section enables users to monitor bid statuses and accept recent bids.

To build trust, we incorporated a testimonial section showcasing customer reviews, along with car listings feature for users to browse available vehicles.

Ensuring a secure and seamless user experience became a priority. We implemented user registration, login, and a 'Forgot Password' section using HTML, CSS, and JavaScript. The 'Forgot Password' feature sends a reset link to the user's email, enabling them to create a new password and regain access.

The integration of Google Firebase proved pivotal, allowing us to securely store user information. Additionally, we developed a 'Get a Quote' functionality, saving quotation entries to Firebase, enabling the storage of these valuable user-provided details."
