

Short Report on Project

- Our project can solve the present problem that many students are facing now a days not only students but also people who are looking to buy the cars at cheaper price.
- ⇒ A Car owners objective is to find offer their car at a better value.
- ⇒ A Car buyers would like to have more choices for selection.
- Our website goal is to get the cars for cheaper price. And, with good condition and history.
- To achieve this, we created quotation entry where the users can enter some basic details about them and their car and get a quote for their car.
- We initiated an idea where users can sell their cars in three simple steps which we eventually added to the sell page which are Quote, Bid and sell.
- We have used HTML, CSS, and JavaScript to build our webpage which we found easy to manage as it is a team project.
- There are a few alternate approaches which we thought at first to build our webpage, where we first thought of using MySQL but accessing MySQL is not easy for the website, so we used to google firebase to save all the information in our webpage.
- There are many websites with regular car website like buy and sell so our approach is to give the customers a good and valued car. Also, we have added an extra option like bid for the cars if one or more persons are interested in that car so we think that that's a new feature in our website.
- Justification for our approach is we only buy the cars with good history and good value for that we will check the history of the cars in some trusted websites this is our justification.
